Adult Echo Protocol Echocardiography Illustrated

Echocardiography in 2D. Two-dimensional (2D) ultrasound is the most commonly used modality in echocardiography. The two dimensions presented are width (x axis) and depth (y axis). The standard ultrasound transducer for 2D echocardiography is the phased array transducer, which creates a sector shaped ultrasound field (Figur 1).

M-mode echocardiography. M-mode was previously the dominating modality in echocardiography. Although it has now largely been replaced by 2D echocardiography, it is still used in clinical practice. M-mode provides a one-dimensional view of all reflectors (i.e. structures reflecting ultrasound waves) along one ultrasound line.

Point-of-care ultrasonography (POCUS) refers to limited bedside ultrasound used to evaluate patients for conditions specific to the scope of their practice. Given the benefits of its application, interest in its use is increasing. We aimed to review the literature and assess the potential feasibility of using POCUS of the heart and lungs in the field of obstetrics.

The incidence of carcinoid tumors is rising. Their expression of hormones or amines is variable and rate of growth slow, which may make diagnosis erroneous or late. Major clinical features remain diarrhea, flushing, bronchospasm, and carcinoid heart disease. There are new and emerging syndromes such as pigmentation, myopathy, neuropathy and other paraneoplastic syndromes.
