The Windows Registry is a hierarchical database that stores low-level settings for the Microsoft Windows operating system and for applications that opt to use the registry. The kernel, device drivers, services, Security Accounts Manager, and user interfaces can all use the registry. The registry also allows access to counters for profiling system performance.

Part of the GC pause that's not doing GC at all - thread suspension; One last part of the GC pauses we haven't mentioned is the part that's not doing the GC work at all - I'm referring to the thread suspension mechanism in the runtime. GC calls the suspension mechanism to get threads in the process to stop before the GC work can start.
